### **Jeff Geerling**

One of the things I have always meant to look at in the past is using DevOps to run Ansible playbooks. However the Ansible Task recommended by Microsoft has always put me off, the reason for this is that this task requires a Virtual Machine to run Ansible - this to me always seemed a little overkill.

Devops Server  
configuration and  
administration of the IT  
infrastructure. In  
contrast to other tools  
such as Chef or Puppet,  
Ansible requires  
neither a server  
component nor a  
repository - that is  
costly and/or requires  
extensive maintenance  
- from which the server  
retrieves the  
configuration data.

Ansible was created by Red Hat as a configuration management tool. It automates all software installation, package management, and configuration on our AWS EC2 hosts. Ansible ensures that any software, config file change, or cron job is installed the same way every time. Ansible is agentless, so your build toolchain has fewer moving parts.
