Topological Methods In Data Analysis

In applied mathematics, topological data analysis (TDA) is an approach to the analysis of datasets using techniques from topology. Extraction of information from datasets that are high-dimensional, incomplete and noisy is generally challenging. TDA provides a general framework to analyze such data in a manner

Topological data analysis - Wikipedia

Topological methods are broadly recognized as valuable tools for analyzing the ever-increasing flood of data generated by simulation or acquisition. This is particularly the case in scientific visualization, where the data sets have long since surpassed the ability of the human mind to absorb every single byte of data.

GEOMETRIC AND TOPOLOGICAL METHODS IN DATA ANALYSIS

With modern advances of the computational aspects of topology, these rich theories of shape can be applied to sparse and high dimensional data, spurring the field of Topological Data Analysis (TDA). Mapper and Persistent homology are the two most popular methods in the field of TDA, but the field is nascent and rich with exciting new ideas.

Abstract Topological Data Analysis (TDA) can broadly be described as a collection of data analysis methods that find structure in data. This includes: clustering, manifold estimation, nonlinear dimension reduction, mode estimation, ridge estimation and persistent homology. This paper reviews some of these methods.

Topological Data Analysis - arXiv

Recently, analyzing data has become more complex because data sets are larger in size and higher in dimension To address this complexity, we looked at determining the shape of a data set using an approach called topological data analysis Calli Clay and Ella Graham (St. Kate's) Finding Structure in Texts with TDA February 1, 2020/17

Finding Structure in Texts with Topological Data Analysis

We propose a method which can be used to reduce high dimensional data sets into simplicial complexes with far fewer points which can capture topological and geometric information at a specified resolution. We refer to our method as Mapper in the rest of the paper. The idea is to provide another tool for a generalized notion of coordinatization for

Topological Data Analysis (TDA) [1, 2] refers to a combination of statistical, computational, and topological methods allowing to find shape-like structures in data. The TDA has proven to be a powerful exploratory approach for complex multi-dimensional and noisy datasets. For TDA to be applied, a dataset is encoded as a finite set of points

Topological Data Analysis and Machine Learning. Our approach to quantifying patterns relies on topological data analysis and machine learning. TDA is an emerging branch of mathematics and statistics that aims to extract quantifiable shape invariants from complex and often large data (43 ↓ ↓ ↓ -47). One of the main tools in TDA is known as persistent homology, which we review now briefly.

A second kind of geometric feature of data we study in topological data analysis is a “loop.” Figure 3 gives an example of a loop in a data set. Again, we’d like to be able to detect a loop in a data set even when it is corrupted by noise, as in Figure 4.

Topological Data Analysis (TDA) is especially suitable for such weblike data and we have used this framework to visualize, define, and do inference on known (i.e., voids) and new (i.e., filament loops) cosmological structures. During this talk, I will discuss how TDA can be used to uncover cosmological structures.
